                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  flt gene encoding receptor type tyrosine kinase. The promoter is useful for the tissue specific expression of heterologous proteins. Vectors contg. the DNA were used to transform vascular endothelial cells, such that a protein of interest could be expressed. The ligand controlling the function of the promoter may be used as a neovascularisation inhibitor.

                                                                                                                                                      The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences (Ss) and sequences complementary to (Ss). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms and also to be used in an array for analysing diseases associated with CpG dinucleotides e.g. ascertaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the
    modified genes associated with tumour suppressor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (ST*
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AGAITTITATACGCGGCTCGGTTTCGGGTTATCGTTTCGTCGTTTTTT 4811

```
Ine invention relates to a nucleic acid comprising a sequence of at least bases of a segment of chancelly pretreated bWh or games associated with cell signalling. The activity of the modified sequences of the invention may be described as cytostatio. The object of the invention is to provide the chancelly modified DNA of genes associated with cell signalling, as well as oligonucleotides and/or PNA-oligomers for particularly suitable for the diagnosis and/or therapy of genetic and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid, useful for diagnosis and therapy of diseases associated with cell signalling e.g. cancer, comprises chemically modified genomic sequences of genes associated with cell signalling
                                                                                                                                                                                             5051

epigenetic parameters or genes associated with cell signalling. The chemically modified DNA provided by the invention is useful for diagnosis and thurspy of diseases such as solid tumours and cancer. The sequences given in records ABL70111-ABL70626 represent chemically pre-treated genomic DNA's of genes associated with cell signalling. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4573
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       4631

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and therapy of e.g. severe combined immunoueficiency disease, cardiac disorders, haemophilia, solid tumours and cancer, werner syndrome, astima, HDR syndrome, Saethre-Chotzen syndrome, renai disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      selected from 43 known genes (or complementary sequences). The Cremical pretreatment converts cytosine bases unmetnylated at the Greatment to uncorner bases with hybridistantic behaviour dissimilar to cytosine, to enable analysis of cytosine methylations. Inc DNA sequences, cliqomers (or sets/arrays) and method are useful in the diagnosis of diseases (or predisposition to diseases) sacciated with gene regulation and in therapy of such diseases, by enabling analysis or the cytosine methylation patterns of such genes, kits are provided. They are especially useful in diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           preeclampsia, graft Persus-host disease. The present sequence is a sequence included in the sequence data for this specification and is associated with the numan gene regulation-associated genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format girecly from WIPO at the wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                  Human gene regulation-associated gene oligonuclectide #125

Human, signal transduction associated gene, cytosine methylation state, CpG island; signal transduction associated disease, solid tumour; cancer, antitumour; cytostatic, mutant; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   modified using a solution of bisulphite, hydrogen supplies or disulphite. Also disclosed are oligonucleotides and/or PNA oligoners for detecting the cytosine methylation state (CpG islands) of these genes, and a method for the dispinosis and/or therapy of genetic and epigenetic parameters of genes associated with signal transduction. The genemic by can be obtained from cells or cellular components which contain DNA, e.g. cell lines, biopsies, blood, sputum, scool, urine, cerebral spinal fluid, tissue embedded in parafilin such as tissue from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequences of the invention are useful for the diagnosis and therapy of diseases associated with signal transduction e.g. solid tumours and cancer. ABK31158-ABK31545 represent chemically pretreated genomic DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printe specification, but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oligonuclectide for diagnosis and therapy of diseases associated with signal transduction e.g. cancer, comprises chemically modified genomic sequences of genes associated with signal transduction –
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               eyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, histologic object slides, and all their possible combinations. ```

The invention relates to a nucleic acid (1) comprising a segment of 18 bases of chemically pretreated DNA of angiogenesis associated genes (11) related oligomers, (ABG66971-ABG67188) or their complements. (1), also related oligomers, are used to evaluate the methylation status and/or single-nucleotide polymorphisms, in angiogenesis-related genes, for neovascular glaucoma, solid tumours, inflammation, theumatoid arthritis, oligetto retinopathy, macular degeneration caused by reovascularisation, postatsis, arteriosclerosis, inflammatory bowel diseases, ulcers and cronn's disease.

anylogenesis-associated genes, useful for determining methylation status, e.g. in diagnosis or treatment of cancer

New nucleic acid fragments from chemically treated

The invention relates to a nucleic acid comprising a sequence of 18 bases, of a segment of chemically pretreated DAM (CP DAM) e.g. with bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since numbers 408, 458 and 500 are missing from the sequence listing) sequences (SS) and sequences complementary to (SS). The nucleic acid may be a peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may form part of a set of probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms and also to be used in an array for analysing diseases associated with CpC dinucleotides e.g. cancers and tumours. The probes can also be used in an exthod for secretaining genetic and/or epigenetic parameters for the diagnosis and/or therapy of existing diseases or the predisposition to specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 533 genomic sequences derived from tumour suppressor genes and oncogenes. Sequences with even numbered Seq ID numbers are the complementary sequence of the corresponding odd numbered sequence (e.g. ID 2 and ID1, ID 536 and ID 535, except for those whose partner sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1865

The invention relates to a nucleic acid comprising a sequence of at least 18 bases of a segment of chemically pretreated DNA of genes associated with cell signalling. The activity of the modified sequences of the invention may be described as cytostatic. The object of the invention is signalling, as well as a cytostatic. The object of the invention is signalling, as well as a lighten object of a method which is particularly suitable for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with cell signalling. The chemically modified DNA provided by the invention is useful for diagnosis and therapy of diseases such as solid tumours and cancer. The sequences given in records ABL70111-ABL70626 represent chemically pre-treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  with cell signalling e.g. cancer, comprises chemically modified genomic sequences of genes associated with cell signalling

```
The invention relates to 224 nucleic acid sequences comprising at least 18 bases of a chemically pretreated gene associated with gene regulation selected from 43 known genes (or complementary sequences). The chemical pretreatment converts cytosine bases unmethylated at the 5-position to uracil or another base with hybridisation behaviour dissimilar to cytosine, to enable analysis of cytosine methylations. The DNA sequences, oligomers (or sers/arrays) and method are useful in the diagnosis of diseases (or predisposition to diseases) associated with gene regulation and in therapy of such diseases, by this are provided. They are especially useful in diagnosis of additional methylation patterns of such genes, kits are provided. They are especially useful in diagnosis and therapy of e.g. severe combined immunodeficiency disease, cardiac disorders, haemophilia, solid tumours and cancer, Werner syndrome, asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          preeclampsia, graft versus-host disease. The present sequence is a sequence included in the sequence data for this specification and is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the printed specification, but was obtained in electronic mat directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    associated with the human gene regulation-associated genes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   o:
                                                                                                                                  Human, signal transduction associated gene, cytosine methylation state, CpG island; signal transduction associated disease; solid tumour; cancer; antitumour; cytostatic; mutant; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       their complementary sequences.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the Buropean Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 signal transduction associated genes. The DNA sequences are chemically modified using a solution of bisulphite, hydrogen sulphite or disulphite. Also disclosed are oligonuclacideds and/or PNA oligoners for detecting the cytosine methylation state (cpc islands) of these genes, and a method for the diagnosis and/or therapy of genetic and epigenetic parameters of genes associated with signal transduction. The genomic DNA can be obtained from cells or cellular components which contain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, cerebral-spinal fluid, tissue embedded in paraffin such as tissue from pistologic object slides, and all their possible combinations. The sequences of the invention are useful for the diagnosis and therapy of diseases associated with signal transduction e.g. solid tumograps and contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Oligonucleotide for diagnosis and therapy of diseases associated with signal transduction e.g. cancer, comprises chemically modified genemic sequences of genes associated with signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1924 TCCGATACCTTCCTAAACTTCTCGAAACAATCTAAAAAATCAAAAAGGACGAACAACG 1855

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           receptor protein which binds to VEGF in extracellular regions adjacent to the primary tumor and vascular endothelial cells. Formation of a SVEGF-R/VEGF complex prevents binding of VEGF-#6 the FLT-I TRR, antagonising transduction of the normal intracellular signals associated with vascular endothelial cell-induced tumour angiogenesis. Expression of a soluble TRR may also impart a therapeutic effect by binding either with or without VEGFs to form
                                                                                                                                                                                                                                                                                                                                      non-functional heterodimers with full-length VEGF-specific TKRs and thereby inhibiting the mitogenic and anglogenic activities of
                                                                        psoriasis, rheumatoid arthritis, haemangioma, diabetic retinopathy, angiofibroma and macular degeneration. For primary tumour growth and metastasis, this involves traffer of a nucleotide sequence encoding a soluble form of VEGF TRE on amamalian (human) host, preferably using an adenovirus or recombinant plasmid DNA vector. The transferred nucleotide sequence transcribes mRNA and a soluble
growth factor (VEGF). PCR cloning was used to obtain the fit-1 derived TRR (SVEGR-RI) stitl-1 cDNA from a HUVEC CDNA library. The invention relates to methods of gene therapy for inhibiting angiogenesis associated with solid tumor growth, tumour metastasis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vascular endothelial cell growth factor; VEGF; receptor; inhibitor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              soluble; treatment; angiogenesis; psoriasis; tumour; arthritis; ss

This is the nucleotide sequence encoding the lst-7th immunoglobulin-like domains of the extracellular domain of VECF (vascular endothelial cell growth factor) receptor FLT. The sequence is amplified by the primars ANV01458-V01459. The VECF receptor sequence can be used to generate truncated mutants which comprise the immunoglobulin-like domains 1-3, 1-4, 1-5 or 1-7. The polypeptides can be used in treatment of solid tumours and other diseases accompanied by pathological vascularisation since they inhibit vascularisation by stimulation with VECF.
